Socio Demographic Factors Affecting Infant Mortality Rate | 5f30514894cfa5538376ddfd8487b4e0

Socio-economic Correlates of Mortality in Japan: “Background Congenital syphilis (CS) is an easily preventable and treatable infectious disease acquired by the fetus in the uterus before birth. Despite a noted global decline in CS rates during the early 2000s, recent data suggest alarming worldwide incidence trends, especially in developing countries. In Brazil, Latin America's most populous country, the incidence of CS has more than tripled since 2010. CS is related to abortion, stillbirth, premature delivery, neurologic sequelae of newborns, and other impairing conditions. A better understanding of these current trends and potentially underlying proliferating factors are critical to inform urgently needed public policies to revert this concerning development. Objective: This research aims to understand the current trends and incidence rates of congenital syphilis in one of Latin America’s highest density populations, the city of Sao Paulo, Brazil. Employing an ecological research approach, this study explores the association between maternal syphilis (MS) & CS incidence rates and population-level socio-demographic factors, and mother & child health indicators. Methods: Epidemiological surveillance data collected at Sao Paulo’s administrative district and technical health supervision (STS) levels were analyzed for the years 2007 to 2018. The data was linked with mother & child health indicator variables available from "Data SES", the Brazilian national health information system. In addition, socio-demographic data was obtained from the Nona Sao Paulo, a research network that aims at increasing inclusiveness, equity, and transparency in public policy. Descriptive analysis and linear mixed effects regression models were used to characterize time trends in MS and CS incidence rates. In addition, graphical modeling using smooth spline functions were used to assess direction, magnitude, and consistency of ecological associations between MS / CS incidence rates and socio-demographic and mother & child health variables. Results: Both maternal and congenital syphilis incidence rates have increased since 2007 with a stronger incline in MS rates (increase of 2.1 vs 0.5 / 1000 livebirths per year). The respective increases for both MS and CS were below the Brazilian national average. However, there was large heterogeneity in incidence rates across districts and STS levels. Profound inverse associations were detected between MS / CS incidence rates and infant mortality rates as well as the rate of adolescent pregnancies in the respective districts / STS, suggesting that effective prenatal care helping lowering infant mortality is currently not sufficient for prevention of congenital syphilis. Conclusion: The findings indicate large variation in MS and CS rates across districts and STS within the city of Sao Paulo, Therefore, within the local context of the city, there are opportunities to further investigate which territories perform better (or much worse) in terms of disease control and prevention than others. Factors contributing to the aggravating MS and CS syphilis epidemic may not only be sought at the population level but also at the local health care provision level.”

Socio-demographic and Economic Factors. Affecting Fertility in Rural and Urban Thailand Master’s Thesis from the year 2011 in the subject Medicine - Public Health, grade: B, Atlantic International University (Social and Human studies), course: Master of Public Health, language: English, abstract: Limited information exists currently on factors associated with “virtual elimination of paediatric HIV” in resource constrained settings since the publication of new PMTCT guidelines by the WHO in 2010. In this study, we aimed to assess predictors of unfavourable infant clinical outcomes (Mortality and HIV infection) at 2 years follow-up in PMTCT program. Using data collected from registers (PMTCT and ANC) at Sichili Mission Hospital, 151 women were enrolled in the program from 2008 to 2010 and 80 of them fulfilled the inclusion criteria. An in-depth interview with HIV positive women was conducted using structured questionnaires. Factors associated with “virtual elimination of paediatric HIV” were determined by multivariable regression analysis models. At 2 years follow-up, 8 (16%) children died (7/12%) were HIV negative and 7 (13%) were HIV positive on HAART. Socio-demographic factors age and education level were correlated with poor infant outcomes in PMTCT program (Pearson coefficient correlation). Socio-demographic factors, PMTCT specific indicators and infant's variables are potential determinants to successful attainment of “Virtual elimination of paediatric HIV by 2015.” KEY WORDS: PMTCT, Virtual Elimination of Paediatric HIV, Sichili Mission Hospital, Socio-demographic variables, infant outcomes, Zambia.

Neonatal and Perinatal Mortality This study is an effort to depict the spatial and temporal variations in fertility and infant mortality and its determination within the state with the view that a better understanding of fertility and infant mortality transition taking place in Bihar either when might be possible fertility and infant mortality transition taking place in Bihar. This study begins with the discussion of how in change is fertility and infant mortality level at district level and the socio-economic and demographic factors affecting fertility and infant mortality at state level through the combination of statistical analytical tools viz, multiple regression and cox regression. Moreover try to understand that when Bihar will be obtain replacement level of fertility and when will be achieve target of infant mortality according millennium development goal through the analytical tool gompertz model. Infant and Child Mortality Feeding during the first two years of life is very important for the nutrition and growth of an infant. It has a great effect on early morbidity and mortality and long-term effects on health. Breastfeeding has many benefits for both the infant and mother, whereas formula feeding, although associated with disadvantages and problems, can be life-saving for infants who need it. This book examines many aspects of infant feeding and nutrition with chapters covering such topics as the impact of the first 1000 days of nutrition on child health and development, breastfeeding, factors behind the decision to breastfeed or formula feed, and the relationship between breastfeeding and gut microbiota, among others.

The Urban Child Institute Candle Study Strategic health planning, the cornerstone of initiatives designed to achieve health improvement goals around the world, requires an understanding of the comparative burden of diseases and injuries, their corresponding risk factors and the likely effects of intervention options. The Global Burden of Disease framework, originally published in 1990, has been widely adopted as the preferred method for health accounting and has become the standard to the setting of the guidance in research priorities. This publication sets out an updated assessment of the situation, with an analysis of trends observed since 1990 and a chapter on the sensitivity of GB estimates to various sources of uncertainty in methods and data. A Study of Infant Mortality in Wisconsin, 1969 This report describes the study design and summary data from the first year of data collection for the Urban Child Institute Conditions Affecting Neurocognitive Development and Learning in Early Childhood Study participant demographics, prenatal and birth measures; child and family health and nutrition; mothers mental and behavioral health; and cognitive performance, psychosocial measures, and biological samples for mothers and children.”

The Relationship of Social-demographic Factors, Birth Weight, and Infant Mortality Among Spanish Surname, Anglo, and Nonwhite Populations in Texas This open access book identifies and discusses biodiversity's contribution to physical, mental and spiritual health and wellbeing. Furthermore, the book identifies the implications of this relationship for nature conservation, public health, landscape architecture and urban planning - and considers the opportunities of nature-based solutions for climate change adaptation. This transdisciplinary book will attract a wide audience interested in biodiversity, ecology, resource management, public health, psychology, urban planning, and landscape architecture. The emphasis is on multiple human health benefits from
biodiversity - in particular with respect to the increasing challenge of climate change. This makes the book unique to other books that focus either on biodiversity and physical health or natural environments and mental wellbeing. The book is written as a definitive 'go-to' book for those who are new to the field of biodiversity and health.

Infant Mortality

Infant Mortality in Kansas Associated with breastfeeding support from the women's husbands, mothers, and health care providers, and if the women were breastfed when they were children. In the stratified analyses, support from the women's husband, mother, and health care providers was the strongest predictor of breastfeeding intention in all the regions. Additionally, in the stratified models, certain regional differences became apparent. Hispanics women in the Northeast were more than 6 times as likely to breastfeed compared to White women, and women living in that region who planned to work during the first postpartum were significantly less likely to intend to breastfeed. Education was positively associated with breastfeeding intentions for women living in the South. Breastfeeding intention is an important predictor of future infant feeding behavior. Health initiatives should be directed at promoting breastfeeding during the prenatal period and towards understanding why certain subgroups of women intend to breastfeed while others do not. Identifying the socio-demographic and regional factors associated with women's lack of intent to breastfeed can help health professionals improve breastfeeding intention rates by designing tailored breastfeeding interventions for the populations of women at risk for not intending to breastfeed.

Geospatial Modeling of Child Mortality Across 27 Countries in Sub-Saharan Africa

Like other developing countries, in Asia, infant and child mortality has been given paramount importance by both academicians and policy makers. This is because this mortality is comparatively high here. This book illustrates infant and child mortality and factors affecting it in the context of different programs and policies implemented by various countries of the region. Also the book compares intra-country and inter-country comparisons of infant and child mortality levels. The book extensively discusses various child health programmes and their effects on infant and child mortality from 1970 to 2006. In addition to that the book also discusses various aspects of demographic, socio-economic and cultural practices that significantly affect infant and child mortality in this region. The book is of immense use in studies related to demography and public health.

Exclusive Breastfeeding-Knowledge, Attitude and Practices of Mothers

Maternal and Child Health Profile for Hispanics in California Preventable mortality of children has been targeted as one of the UN's Sustainable Development Goals for the 2015-30 period. Global decreases in child mortality (4q1) have been seen, although sub-Saharan Africa remains an area of concern, with child mortality rates remaining high relative to global averages or even increasing in some cases. Furthermore, the spatial distribution of child mortality in sub-Saharan Africa is highly heterogeneous. Thus, research that identifies primary risk factors and protective measures in the geographic context of sub-Saharan Africa is needed. In this study, household survey data collected by The Demographic and Health Surveys (DHS) Program aggregated at DHS sub-national area scale are used to evaluate the spatial distribution of child mortality (age 1 to 4) across 27 sub-Saharan Africa countries in relation to a number of demographic and health indicators collected in the DHS surveys. In addition, this report controls for spatial variation in potential environmental drivers of child mortality by modeling it against a suite of geospatial datasets. These datasets vary across the study area in an autoregressive spatial model that accounts for the spatial autocorrelation present in the data. This study shows that socio-demographic factors such as birth interval, stunting, access to health facilities and literacy, along with geospatial factors such as prevalence of Plasmodium falciparum malaria, variety of ethnic groups, mean temperature, and intensity of light at night can explain up to 60% of the variance in child mortality across 255 DHS sub-national areas in the 27 countries. Additionally, three regions - Western, Central, and Eastern Africa - have markedly different mortality rates. By identifying the relative importance of policy-relevant socio-demographic and environmental factors, this study highlights priorities for research and programs targeting child mortality over the next decade. - See more at: http://dhsprogram.com/publications/publication-SAR13-Spatial-Analysis-Reports.cfm#sNzhkNc2V5hKpdpwv

The Determinants and Consequences of Population Trends

New Approaches to Death in Cities during the Health Transition

A Descriptive Study of Demographic and Socio-economic Factors Influencing Infant Feeding Practices in the Amathole District, South Africa This cross-sectional research was intended to characterize the situation of child development, and to investigate the factors associated with development status, in children aged 3-5 years in Mnangathu Primary Care Unit Selaphum District Roi-et Province. 210 participants were studied. Data were collected with 2 forms: (1) A questionnaire that developed by the researcher and based on the Maternal and Child Care Handbook, the Encouragement of Early Child Development Handbook, and the related literature, the questions measured factors potentially affecting child development (independent variables), These were divided into 3 groups; a) Socio demographic, b) Birth, nutrition and medical history, and c) Developmental history. (2) Using the assessment of child development Anamal 49 that developed by the Department of Health to assess the child development, the assessment had provided child development on 2 ways, either normal development or delayed development. This was the dependent variable. The collected data were analyzed by the statistics of Frequency, Percentage, Crosstabs, Chi-square, and Multiple Logistic Regression, the research...
An Evaluation of the Effects of Medical Care and Socio-demographic Factors on Infant and Pre-school Childhood Mortality Rates in Chile and Argentina, 1960-1970 The current research addresses the "nature versus nurture" question by examining interrelationships between socio-demographic variables, early childhood socialization, child temperament, and the outcomes of aggression and delinquency. Measures of parenting and child maltreatment were used to capture socialization. Measures of temperament were used as proxies for biological and genetic influences. The analysis contains three components: (1) an initial test of overlap between socialization and temperament measures to assess the extent to which they are analytically independent, (2) a comparative test of temperament versus socialization as mediators of effects of socio-demographic variables on child aggression and delinquency, and (3) a test of the interactive influences of temperament and socialization on these outcomes. Data come from the Project on Human Development in Chicago Neighborhoods (PHDCN). The analysis consists of a series of hierarchical linear models addressing the above research goals. Results of the overlap test show the socialization measures to account for approximately 15 percent of variation in child impulsivity, 10 percent of child emotionality, 2 percent of child activity level, and 1 percent of child sociability. Results of the mediation analysis show that, contrary to what was predicted, both the temperament and socialization factors mediate effects of many of the same socio-demographic variables on aggression and delinquency, including those of both the child and caregiver (e.g., child sex, caregiver income, caregiver age, intact family, Hispanic). Results of the third stage of analysis show that effects of temperament traits conducive to aggression and delinquency (i.e., impulsivity) become stronger in response to negative socialization in households. Conversely, protective dimensions of socialization (i.e., supervision, punishment avoidance) were found to reduce the effects of negative temperament dimensions (i.e., impulsivity) on aggression and delinquency. The implications of these results are discussed in the final section of the dissertation.

The Association Between Socio-demographic Factors and Intention to Breastfeed by Region of the United States This book presents recent efforts and new approaches to improve our understanding of the evolution of health and mortality in urban environments in the long run, looking at transformation and adaptations during the process of rapid population growth. In a world characterized by large and rapidly evolving urban environments, the past and present challenges cities face is one of the key topics in our society. Cities are a world of differences and, consequently, of inequalities. At the same time cities remain, above all, the spaces of interactions among a variety of social groups, the places where poor, middle-class, and wealthy people, as well as elites, have coexisted in harmony or tension. Urban areas also form specific epidemiological environments since they are characterized by population concentration and density, and a high variety of social spaces from wealthy neighborhoods to slums. Inversely and coherently, cities develop answers in terms of sanitary policies and health infrastructures. This balance between risk and protective factors is, however, not at all constant across time and space and is especially endangered in periods of massive demographic growth, particularly periods of urbanization mainly led by immigration flows that transform both the socioeconomic and demographic composition of urban populations and the morphological nature of urban environments. Therefore this book is an unique contribution in which present day and past socio-demographic and health challenges confronted by big urban environments are combined.

Socio-economic and Cultural Correlates of Infant Mortality ABSTRACT: The period 1980-2000 was important for infant health in Florida and the United States more generally. This period of dramatic social change and substantial improvements in therapeutic technology has produced striking improvements in infant health and survival. Despite overall declines in all-cause infant mortality, some evidence has suggested that changes in the maternal, socio-demographic factors associated with these racial disparities are well-established areas of research, several points remain unclear. First, it is not well known which causes of death have contributed to the widening racial disparities in infant mortality. Second, it is unclear whether the changing social context may have affected these patterns. Finally, it is unknown which has been more influential, changes in the social context or changes in individual maternal socio-demographic characteristics.

Factors Affecting Development of Children Aged 3-5 Years in Muangphrai Primary Care Unit, Selaphum District, Roi-Et Province, Thailand The purpose of this report is to summarize the literature concerning the relationship of breastfeeding and various infant and maternal health outcomes. Two key questions are addressed: 1. What are the benefits and harms for infants and children in terms of short-term outcomes, such as infectious diseases (including sepsis, meningitis, and respiratory tract infections), sudden infant death syndrome (SIDS) and infant mortality, and longer term outcomes such as cognitive development, childhood cancer (including leukemia), type I and II diabetes, asthma, atopic dermatitis, cardiovascular disease (including hypertension), hyperlipidemia, and obesity, compared among those who mostly breastfeed, mostlyformula feed, and mixed feed; and how are these outcomes associated with duration of the type of feeding? Do the harms and benefits differ for any specific subpopulations based on socio-demographic factors? 2. What are the benefits and harms on maternal health short-term outcomes, such as postpartum depression and recovery to pre-pregnancy weight, and long-term outcomes, such as breast cancer, ovarian cancer, diabetes and osteoporosis, compared among breastfeeding, formula feeding, and mixed feeding, and how are these associated with duration of the type of feeding? Do the harms and benefits differ for any specific subpopulations based on socio-demographic factors?

Preterm Birth

Mother-infant Interactions in Preterm and Term Samples Infant mortality is a worldwide problem with the highest rates being recorded in developing countries. Low infant birth weight and stunting are among the major contributing factors towards the problem. Over 20 million infants worldwide are born with low birth weight with more than 95.6% of these infants being born in developing countries. An infant's birth weight and length are dependant on a number of factors including maternal related factors. This book highlights the relationship between Maternal Anthropometry (height, weight and MUAC), Socio-demographic Factors and Infant Anthropometry (weight and length) at birth. The findings are useful in providing a new insight of other interventions that may be incorporated in the Antenatal Clinics in addition to the existing ones to curb the high rates of infant mortality in developing countries.

Infant Anthropometry at Birth in Relation to Selected Maternal Factors

An Investigation of Racial Disparities in Infant Mortality Across the United States The aim of this study was to describe the demographic and socio-economic factors influencing infant feeding practices in the Amathole district, South Africa. A survey was chosen as the design method and a structured questionnaire was used to collect information regarding the socio-economic and demographic factors and related infant feeding choices. The study population consisted of 100 women with infants up to the age of 14 weeks, who brought their infant for immunization at the selected community health clinic (the largest clinic in the Mdantsane area). Infants up to the age of 14 weeks were used because all the visits up to 14 weeks coincide with the local immunization program, and according to WHO guidelines all infants should be exclusively breastfed until they reach the age of 6 months of age. The study found that there are many families in the Mdantsane area that suffer from poor conditions and inadequate services such as a lack of electricity, working taps or flush toilets within their dwelling, which in turn has an impact on infant feeding practices. It was found that even in poor demographic and socio-economic conditions, formula feeding is still the chosen feeding practice for the majority of mothers.

Population Dynamics of Kenya Study conducted in East Godavari and Medak districts of Andhra Pradesh.

Breastfeeding and Maternal and Infant Health Outcomes in Developed Countries
Effects of Socio-demographic factors on Infant Mortality in Purworejo, Central Java, Indonesia Master’s Thesis from the year 2017 in the subject Sociology - Gender Studies, grade: 4.0, Obafemi Awolowo University (Faculty of Social Sciences), course: Demography and Social Statistics, language: English, abstract: This study assessed the pattern of breastfeeding practices among mothers; and determined the relationship between women’s socio-demographic characteristics and their breastfeeding practices in Northern Nigeria; examined the relationship between women’s socio-demographic characteristics and infant mortality and ascertained the relationship between breastfeeding practices and infant mortality. The study employed both primary and secondary sources of data collection. Forty in-depth interviews (IDIs) were conducted in four randomly selected states. Plateau and Kaduna states were selected from North Central and North West respectively. Ten IDIs were carried out in each of these four states. Five IDIs were conducted in randomly selected rural areas of each of the four states. Content analysis was employed to analyse responses from IDIs. The secondary data for the study were obtained from the Nigeria Demographic Health Surveys (NDHS 2008). The Study elicited information from 33,385 women of reproductive age between 15 and 49 years, as well as information from 28,647 children whose ages were below five years. The 2008 NDHS data on women of reproductive age between 15 and 49 years in Northern Nigeria who have had at least a child in the past five years preceding the survey were extracted for 12,216. The 2008 NDHS Data on children of age below five years old in the North of Nigeria were extracted for 19,552. The secondary data were analysed using frequency distribution, chi-square test, binary logistic and Cox regression statistics. The results on the pattern of breastfeeding practices among mothers showed that complementary breastfeeding was more practiced among mothers who were dwelling in the urban areas than mothers that were residing in the rural areas; while exclusive breastfeeding was predominant among mothers dwelling in the rural areas than mothers residing in urban areas particularly among mothers that were not gainfully employed. The cox regression survival analysis results showed that infant mortality was significant with exclusive breastfeeding (hazard ratio=0.0829, p

Geospatial Modeling of Child Mortality Across 27 Countries in Sub-Saharan Africa This report provides neonatal and perinatal mortality estimates by country, regional groupings and globally. For countries that do not have data, models were developed to estimate mortality. Since data on deaths come from a number of different sources, the methods used to obtain the estimates are also described. Country-specific estimates of stillbirth and early neonatal deaths are published here for the first time. Estimates of stillbirth deaths that occur during delivery (intrapartum) by regional groupings, as well as estimates of sex ratio in neonatal, early neonatal and stillbirth mortality for the developing world are also included.--Publisher's description.

Changes in Fertility and Infant Mortality and Future Prospect in Bihar Socialization Versus Temperament as Mediators of Socio-demographic Risk Factors for Child Aggression and Delinquency One in three babies in India are born with moderate to severe malnutrition with birth weight of 2500 gm or below. Babies having low birth weight are more susceptible to infection and they do not grow to their full potential of physical and mental abilities and start their life at disadvantage leading to high infant morbidity and mortality. Hence it is imperative to identify the newborns with low birth weight and to offer them adequate and needed care instantly for their survival 147. A prospective longitudinal community based study was carried out in the field practice area of Urban Health Centre, Chetla, Kolkata from May 2004 - April 2005 among 126 infants born during the first three months of the study period to analyze the following objectives: 1. To study the incidence of low birth weight babies among the study subjects and to note the effect of certain socio demographic factors on their causation. 2. To compare the physical growth pattern of low birth weight and normal birth weight babies under study. 3. To find out the frequency and type of morbidity among low birth weight and normal birth weight babies under study.

Determinants of Infant Mortality in a Backward Region of North India Protection of Mother to Child Transmission of HIV Socio-demographic Factors, Breastfeeding Practices and Infant Mortality in Northern Nigeria This book presents the three most important parameters of exclusive breastfeeding namely knowledge, attitude and practice. Exclusive breastfeeding is the practice of feeding the infant for the first six months of life on breast milk only, without any other type of food, not even water. This is the critical stage where the future of the child is determined and that is why exclusive breastfeeding is recommended as the best feeding alternative for infants up to six months. The socio-demographic and availability of health services in an area determines the level of practice of exclusive breast feeding. In relation to this, exclusive breastfeeding practices of women in urban areas are changing fast due to the change in urbanization and the growing challenge for the poor women in securing their daily bread. This book investigates the socio demographic factors in determining the knowledge, attitude and exclusive breastfeeding practice of women in Bahir Dar City (Ethiopia) and draws policy implications for improving the situation.

Biodiversity and Health in the Face of Climate Change Socio-cultural and Demographic Factors Affecting Child Survival in D.I.Yogakarta (DIY) and Nuastomong Garar (NTB) - Indonesia The increasing prevalence of preterm birth in the United States is a complex public health problem that requires multifaceted solutions. Preterm birth is a cluster of problems with a set of overlapping factors of influence. Its causes may include individual-level behavioral and psychosocial factors, sociodemographic and neighborhood characteristics, environmental exposure, medical conditions, infertility treatments, and biological factors. Many of these factors co-occur, particularly in those who are socioeconomically disadvantaged or who are members of racial and ethnic minority groups. While advances in perinatal and neonatal care have improved survival for preterm infants, those infants who do survive have a greater risk than infants born at term for developmental disabilities, health problems, and poor growth. The birth of a preterm infant can also bring considerable emotional and economic costs to families and have implications for public-sector services, such as health insurance, educational, and other social support systems. Preterm Birth assesses the problem with respect to both its causes and outcomes. This book addresses the need for research involving clinical, basic, behavioral, and social science disciplines. By defining and addressing the health and economic consequences of prematurity birth, this book will be of particular interest to health care professionals, public health officials, policy makers, professional associations and clinical, basic, behavioral, and social science researchers.

Racial Disparities in Infant Health Preventable mortality of children has been targeted as one of the UN’s Sustainable Development Goals for the 2015-30 period. Global decreases in child mortality (4q1) have been seen, although sub-Saharan Africa remains an area of concern, with child mortality rates remaining high relative to global averages or even increasing in some cases. Moreover, the spatial distribution of child mortality in sub-Saharan Africa is highly heterogeneous. Thus, research that identifies primary risk factors and protective measures in the geographic context of sub-Saharan Africa is needed. In this study, household survey data collected by The Demographic and Health Surveys (DHS) Program aggregated at DHS sub-national area scale are used to evaluate the spatial distribution of child mortality (age 1 to 4) across 27 sub-Saharan Africa countries in relation to a number of demographic and health indicators collected in the DHS surveys. In addition, this report controls for spatial variation in potential environmental drivers of child mortality by modeling it against a suite of geospatial datasets. These datasets vary across the study area in an aggregative spatial model that accounts for the spatial autocorrelation present in the data. This study shows that socio-demographic factors such as birth interval, stunting, access to health facilities and literacy, along with geospatial factors such as prevalence of Plasmodium falciparum malaria, variety of ethnic groups, mean temperature, and intensity of lights at night can explain up to 60% of the variance in child mortality across 255 DHS sub-national areas in the 27 countries. Additionally, three regions - Western, Central, and Eastern Africa - have markedly different mortality rates. By identifying the relative importance of policy-relevant socio-demographic and environmental factors, this study highlights priorities for research and programs targeting child mortality over the next decade. - See more at: http://dhsprogram.com/publications/publication-SARI3-Spatial-Analyst-Reports.cfm#nashKe2V5K2c.dpuf
